## Portfolio Allocation at a Glance

## A) Target Allocation

| Asset Class                         | Weight      | Purpose / Role in the Portfolio                                                                                                                                                                                         |
|-------------------------------------|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| US Equities                         | 35%         | Core return engine; largest, deepest, most liquid equity market globally. Dominant technology and innovation exposure. Implemented via synthetic ETF to maximise net return through reduced US withholding tax leakage. |
| European Equities (incl. CH)        | 20%         | Deliberate moderate home-bias providing EUR-denominated equity exposure with lower currency risk. Diversified across financials, industrials, healthcare, and consumer staples.                                         |
| Japan Equities                      | 7%          | World's third-largest equity market; low correlation to US tech cycle; exposure to yen carry dynamics and domestic reform themes. Left unhedged to retain structural diversification.                                   |
| Emerging Markets Equities           | 13%         | Long-run growth premium and geographic diversification across Asia, India, Brazil, and EMEA. Higher volatility consistent with the high-risk mandate and long horizon.                                                  |
| Global Aggregate Bonds (EUR Hedged) | 12%         | Portfolio stabiliser and diversifier. Currency-hedged to EUR to eliminate bond FX noise. Investment-grade diversification across governments, agencies, and corporates globally.                                        |
| Gold (Physical ETC)                 | 5%          | Real asset / crisis hedge; low-to-negative equity correlation, inflation protection, EUR purchasing power insurance. XETRA-listed physical instrument.                                                                  |
| Bitcoin ETP                         | 3%          | High-conviction speculative allocation reflecting growing institutional acceptance. Hard cap of 5% to contain tail risk. Physically backed, XETRA-listed ETP.                                                           |
| Cash / Money Market (EUR)           | 5%          | Liquidity buffer, rebalancing reserve, and opportunity fund. Held in EUR-denominated overnight-rate instrument to avoid drag while preserving flexibility.                                                              |
| <b>TOTAL</b>                        | <b>100%</b> |                                                                                                                                                                                                                         |

## B) ETF Implementation

All instruments are listed on XETRA Deutsche Boerse unless noted. All ETFs are accumulating share classes to support long-term compounding. The Bitcoin ETP is an ETP (not UCITS) — the only available structure for European crypto exposure; flagged as permitted exception per design requirement.

| Asset Class       | Wt. | ETF / ETP Name                                 | ISIN         | Ticker       | TER     | Dom.        | Replication |
|-------------------|-----|------------------------------------------------|--------------|--------------|---------|-------------|-------------|
| US Equities       | 35% | Invesco S&P; 500 UCITS ETF Acc                 | IE00B3YCGJ38 | P500 (XETRA) | 0.05 %  | Ireland     | Synthetic   |
| European Equities | 20% | iShares Core MSCI Europe UCITS ETF EUR (Acc)   | IE00B4K48X80 | EUNK (XETRA) | 0.12 %  | Ireland     | Physical    |
| Japan Equities    | 7%  | Xtrackers MSCI Japan UCITS ETF 1C              | LU0274209740 | DBXJ (XETRA) | 0.12 %  | Luxembourg  | Physical    |
| EM Equities       | 13% | iShares MSCI EM UCITS ETF (Acc)                | IE00B4L5YC18 | EUNM (XETRA) | 0.18 %  | Ireland     | Physical    |
| Global Agg. Bonds | 12% | iShares Core Global Agg Bond EUR Hdg (Acc)     | IE00BDBRDM35 | EUNA (XETRA) | 0.10 %  | Ireland     | Physical    |
| Gold              | 5%  | Xetra-Gold ETC                                 | DE000A0S9GB0 | 4GLD (XETRA) | 0.00 %* | Germany     | Physical    |
| Bitcoin           | 3%  | 21Shares Bitcoin Core ETP                      | CH1199067674 | 21BC (XETRA) | 0.10 %  | Switzerland | Physical    |
| Cash / Money Mkt  | 5%  | Xtrackers EUR Overnight Rate Swap UCITS ETF 1C | LU0290358497 | XEON (XETRA) | 0.10 %  | Luxembourg  | Synthetic   |

\* Xetra-Gold TER is stated as 0.00%; the economic cost is ~0.36% p.a. via a gold-quantity reduction (physical storage cost embedded in NAV, per prospectus). This remains cost-competitive vs. peer gold ETCs.

### ETF Selection Rationale

| ETF                              | Key Rationale                                                                                                                                                                             |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Invesco S&P; 500 (P500)          | ~EUR 31bn AUM; swap structure eliminates 15% US withholding tax leakage — structural net-return advantage of ~18-22bp p.a. vs. physical peers; fully UCITS-compliant; very tight bid/ask. |
| iShares MSCI Europe (EUNK)       | ~EUR 15bn AUM; largest MSCI Europe tracker; covers ~400 stocks across 15 developed European markets incl. Switzerland and UK; natively EUR-denominated.                                   |
| Xtrackers MSCI Japan (DBXJ)      | ~EUR 2.6bn AUM; cheapest MSCI Japan tracker on XETRA at 0.12%; full physical replication; unhedged to preserve JPY crisis-hedge property.                                                 |
| iShares MSCI EM (EUNM)           | ~EUR 7.4bn AUM; best-in-class UCITS EM liquidity; ~1,400 stocks across 24 EM; 0.18% TER is highly competitive for this asset class.                                                       |
| iShares Global Agg Bond (EUNA)   | ~EUR 2.4bn AUM; cheapest EUR-hedged Global Agg tracker; ~10,000 bonds; full currency hedge removes USD/JPY/GBP noise for EUR investor.                                                    |
| Xetra-Gold (4GLD)                | ~EUR 22bn AUM; physically backed by allocated gold; German domicile; deepest gold ETC on XETRA; redeemable in physical gold — strongest investor protection.                              |
| 21Shares Bitcoin Core ETP (21BC) | ~EUR 345m AUM; most cost-efficient Bitcoin ETP on XETRA (0.10%); 100% physically backed; 21Shares holds 26% XETRA crypto market share; XETRA-listed via Swiss domicile.                   |
| Xtrackers EUR Overnight (XEON)   | ~EUR 5bn AUM; tracks EUR short-term rate (EUR STR); standard EUR cash-equivalent for ETF portfolios; minimal duration and credit risk.                                                    |

## C) Summary of Key Design Decisions

- **Equity weight: 75%.** Sits at the upper end of the 60–80% equity band, reflecting the high-risk mandate and long horizon. Consistent with a maximum drawdown tolerance of 40–50% in a severe bear market — which a  $\geq 10$ -year investor can absorb.
- **Regional equity mix — away from naïve cap-weighting.** A strict global-cap-weighted approach would allocate ~70% of the equity sleeve to the US alone (MSCI World, Feb 2026). This portfolio deliberately departs: US equity is ~47% of the equity sleeve, Europe ~27%, EM ~17%, Japan ~9%. Single-country concentration risk is reduced while maintaining meaningful growth exposure.
- **European home bias: deliberate but bounded.** A EUR-base investor has structural reasons for a moderate home bias — no currency risk, EUR revenue alignment, and tax treatment. However, heavy Europe overweight sacrifices US innovation and EM growth premia. The 20% Europe allocation is a calibrated tilt, not naïve proximity bias.
- **Synthetic ETF for US equities — structural, not speculative.** The Invesco S&P; 500 ETF uses unfunded swap replication. Physical UCITS funds holding US equities pay 15% withholding tax on dividends under the US–Ireland tax treaty. Synthetic replication avoids this entirely. With the S&P; 500 yielding ~1.2–1.5% gross, this generates ~18–22bp of structural annual advantage. The fund is fully UCITS-compliant with counterparty exposure limits (10% of NAV) and a collateral basket. No other ETF uses a synthetic structure except XEON (risk-free overnight rate — minimal risk).
- **Currency hedging — applied selectively.** (1) Global bonds: fully hedged to EUR — FX would dominate returns on a low-volatility asset. (2) US equities: unhedged — equity volatility swamps FX effects; USD appreciates in risk-off periods providing a natural hedge. (3) Japan: unhedged — JPY has crisis-hedge properties; the EUR-hedged variant costs 28bp more p.a. (0.40% vs 0.12%). (4) EM: unhedged — hedging costs are prohibitive; basket effect limits single-currency concentration. (5) Gold and Bitcoin: unhedged — their return drivers dominate currency effects over the long run.
- **Gold (5%) — targeted real-asset hedge.** Provides crisis insurance, inflation protection, and a partial USD/EUR diversifier. Xetra-Gold is the preferred vehicle: physically allocated, German-domiciled, AUM ~EUR 22bn, redeemable in physical gold. Broader commodity indices excluded due to severe roll costs (often 5–8% p.a. in contango markets).
- **Bitcoin (3%) — small, hard-capped speculative position.** Included as a return enhancer with asymmetric payoff characteristics and uncorrelated return drivers in certain regimes. The 3% weight limits maximum portfolio damage if Bitcoin falls to zero. The 21Shares Bitcoin Core ETP is physically backed and XETRA-listed with the lowest TER (0.10%) among peers. Note: all European crypto instruments are ETPs (not UCITS) — this is standard market structure.
- **No listed real estate (REITs).** At 75% equity, the portfolio already carries substantial economic sensitivity. European REIT exposure is implicitly captured within MSCI Europe. Adding a REIT ETF would create a 9th position for marginal diversification gain given the high correlation of listed REITs with broad equities, particularly in rising-rate environments.
- **No broad commodity index.** Roll costs in commodity futures ETFs are severe and detract materially from the diversification benefit. Gold is retained as a focused commodity position with no roll cost, superior liquidity, and a cleaner risk narrative.
- **ETF count discipline: 8 positions.** Achieves diversification across 6 asset classes, 5 geographies, and 3 currencies with no redundant overlap. Weighted average TER is ~0.11% p.a. — roughly 70–140bp per annum cheaper than comparable active multi-asset funds in Europe.

# Look-Through Asset Allocation

Because the equity and bond ETFs each hold hundreds of underlying securities, the stated allocation masks the true economic exposure. The table below shows approximate look-through adjusted weights. Bond and EM figures are derived from Bloomberg Global Agg and MSCI EM index compositions as of early 2026.

| Underlying Exposure                                         | Approx. Look-Through Weight |
|-------------------------------------------------------------|-----------------------------|
| US equities (large/mid-cap)                                 | 35.0%                       |
| European equities (ex-UK)                                   | ~13.5%                      |
| UK equities                                                 | ~3.5%                       |
| Swiss equities                                              | ~3.0%                       |
| Japanese equities                                           | 7.0%                        |
| EM Asia (China, Taiwan, India, Korea)                       | ~9.1%                       |
| EM Other (Brazil, Saudi Arabia, South Africa, Mexico, etc.) | ~3.9%                       |
| US Treasuries / Agency bonds                                | ~4.3%                       |
| EUR sovereign & corporate bonds                             | ~2.4%                       |
| Non-EUR / non-USD bonds (JPY, GBP, etc.)                    | ~2.2%                       |
| Other non-US govt / corp bonds                              | ~3.1%                       |
| Gold (physical)                                             | 5.0%                        |
| Bitcoin                                                     | 3.0%                        |
| EUR cash equivalent                                         | 5.0%                        |
| <b>TOTAL</b>                                                | <b>~100%</b>                |

## D) Consolidated Currency Overview (After Hedging)

| Currency                               | Approx. Portfolio Weight | Notes                                                                                                                                                           |
|----------------------------------------|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>EUR</b>                             | ~35–40%                  | European equities (natively EUR), EUR cash/money market, EUR-hedged bonds                                                                                       |
| <b>USD (unhedged)</b>                  | ~48–53%                  | US equities, gold and Bitcoin (USD-priced), EM equities (partially USD-denominated), MSCI Japan share class (USD, underlying JPY)                               |
| <b>JPY (unhedged)</b>                  | ~5–7%                    | Underlying Japanese equity exposure via DBXJ. JPY retains its crisis-hedge property; cost of hedging (28bp p.a.) does not justify elimination of this benefit.  |
| <b>EM currencies basket (unhedged)</b> | ~9–11%                   | Underlying EM equity mix (CNH, INR, TWD, KRW, BRL, etc.). Basket effect limits single-currency concentration; hedging EM currencies is prohibitively expensive. |
| <b>GBP / CHF / Other</b>               | ~3–5%                    | Look-through via MSCI Europe ETF. UK and Switzerland equity exposure embedded; no separate hedging applied.                                                     |

Key observation: The portfolio carries approximately 50–55% economic USD exposure on a look-through basis, reflecting USD dominance in global equity markets and commodity pricing. This is appropriate for a global growth-oriented portfolio — the USD exposure is embedded in the returns of globally operating companies, not pure currency speculation. The only currency hedge maintained is on the bond allocation, where FX would otherwise dominate fixed income returns.

## E) Ten Largest Equity Holdings (Look-Through Basis)

Approximate individual equity positions derived from index compositions of the four equity ETFs, applied to their respective portfolio weights. Figures are indicative, based on MSCI index data as of early 2026.

| #                   | Company                      | Country     | Approx. Portfolio Weight |
|---------------------|------------------------------|-------------|--------------------------|
| 1                   | Apple Inc.                   | USA         | ~2.5%                    |
| 2                   | NVIDIA Corporation           | USA         | ~2.3%                    |
| 3                   | Microsoft Corporation        | USA         | ~2.1%                    |
| 4                   | Amazon.com Inc.              | USA         | ~1.4%                    |
| 5                   | Meta Platforms Inc.          | USA         | ~1.0%                    |
| 6                   | Alphabet Inc. (A+C combined) | USA         | ~1.0%                    |
| 7                   | Tesla Inc.                   | USA         | ~0.6%                    |
| 8                   | Broadcom Inc.                | USA         | ~0.6%                    |
| 9                   | ASML Holding                 | Netherlands | ~0.5%                    |
| 10                  | Novo Nordisk                 | Denmark     | ~0.4%                    |
| <b>Top 10 Total</b> |                              |             | <b>~12–14%</b>           |

Concentration observation: Positions 1–8 are all US large-cap technology or technology-adjacent companies. This reflects the structural dominance of US mega-cap tech in global indices as of 2026 and is a known, acknowledged concentration risk. The explicit tilts to Europe, Japan, and EM partially mitigate this. Investors with heightened sensitivity to Magnificent-7 concentration may consider an equal-weight S&P; 500 variant for the US sleeve, accepting a modest TER increase.

## F) Rebalancing Concept

Rules-based, threshold-triggered rebalancing to maintain strategic weights and prevent unintended risk drift — without over-trading or generating unnecessary transaction costs.

### Triggers

- **Primary (threshold):** Any asset class deviates more than  $\pm 5$  percentage points from target weight. Immediate action required. Bitcoin uses a tighter band of  $\pm 2$ pp with a hard cap at 5% of portfolio.
- **Secondary (calendar):** Semi-annual review (every 6 months). If any position deviates  $\geq 3$ pp from target at the time of review, rebalance to target.
- **Strategic review:** Full allocation review every 3–5 years to reassess whether target weights, eligible asset classes, and instrument choices remain appropriate (not market-timing).

### Tolerance Bands

| Asset Class            | Target | Rebalance Band | Hard Cap |
|------------------------|--------|----------------|----------|
| US Equities            | 35%    | 30% – 40%      | —        |
| European Equities      | 20%    | 15% – 25%      | —        |
| EM Equities            | 13%    | 8% – 18%       | —        |
| Global Bonds (EUR Hdg) | 12%    | 7% – 17%       | —        |
| Japan Equities         | 7%     | 4% – 10%       | —        |
| Cash / Money Market    | 5%     | 2% – 8%        | —        |

|         |    |         |           |
|---------|----|---------|-----------|
| Bitcoin | 3% | 1% – 5% | <b>5%</b> |
|---------|----|---------|-----------|

Execution preference: Use new cash contributions to under-weight positions before selling over-weight positions, to minimise transaction costs and defer capital gains tax realisation. Where cash flows are insufficient, sell the furthest-from-target over-weight position first.

### G) Weighted Average TER

| ETF / ETP                                  | Ticker | Portfolio Weight | TER     | Weighted TER |
|--------------------------------------------|--------|------------------|---------|--------------|
| Invesco S&P; 500 UCITS ETF Acc             | P500   | 35%              | 0.05%   | 0.018%       |
| iShares Core MSCI Europe UCITS ETF (Acc)   | EUNK   | 20%              | 0.12%   | 0.024%       |
| iShares MSCI EM UCITS ETF (Acc)            | EUNM   | 13%              | 0.18%   | 0.023%       |
| iShares Core Global Agg Bond EUR Hdg (Acc) | EUNA   | 12%              | 0.10%   | 0.012%       |
| Xtrackers MSCI Japan UCITS ETF 1C          | DBXJ   | 7%               | 0.12%   | 0.008%       |
| Xtrackers EUR Overnight Rate Swap ETF 1C   | XEON   | 5%               | 0.10%   | 0.005%       |
| Xetra-Gold ETC                             | 4GLD   | 5%               | ~0.36%* | 0.018%       |
| 21Shares Bitcoin Core ETP                  | 21BC   | 3%               | 0.10%   | 0.003%       |
| TOTAL (Weighted Average TER)               |        | 100%             |         | ~0.111%      |

\* Economic cost for Xetra-Gold is ~0.36% p.a. via gold-quantity reduction (prospectus-disclosed physical storage cost).

|                                   |            |                                                        |                                             |
|-----------------------------------|------------|--------------------------------------------------------|---------------------------------------------|
| <b>~0.11% p.a. This Portfolio</b> | <b>VS.</b> | <b>0.80–1.50% p.a. Typical Active Multi-Asset Fund</b> | <b>~70–140bp p.a. Annual Cost Advantage</b> |
|-----------------------------------|------------|--------------------------------------------------------|---------------------------------------------|

Note: Transaction costs (bid/ask spreads, brokerage commissions) and currency hedging costs for the bond sleeve (~0.20–0.40% p.a. depending on EUR/USD short-term rate differentials) are additive but separate from the TER calculation shown above.

## Investment Disclaimer

---

This document is provided for informational and illustrative purposes only. It does not constitute investment advice, a personal recommendation, or an offer or solicitation to buy or sell any financial instrument or security. The reference portfolio described herein is a model construction based on publicly available information and does not represent the actual investment activity of any person or institution.

The information contained in this document has been compiled with care, but no warranty is given as to its accuracy, completeness, or timeliness. All data regarding ETF names, ISINs, TERS, AUM figures, and index weights are sourced from publicly available data as of April 2026 and are subject to change without notice. Always verify ETF details with the official fund prospectus (KID/KIID) and the relevant exchange prior to investing.

**Past performance is not a reliable indicator of future results.** Investing in financial instruments involves risk, including the risk of partial or total loss of invested capital. The value of investments and the income from them may go down as well as up, and may be affected by currency fluctuations, market conditions, geopolitical events, and changes in regulation.

Specific risks relevant to this portfolio include, but are not limited to:

- **Equity market risk:** High equity allocation (75%) exposes the portfolio to significant drawdown in equity bear markets.
- **Concentration risk:** Significant exposure to US technology mega-caps on a look-through basis.
- **Emerging markets risk:** EM equities carry elevated political, regulatory, liquidity, and currency risks.
- **Crypto / Bitcoin risk:** Bitcoin and other digital assets are highly speculative, subject to extreme volatility, regulatory uncertainty, technological risk, and potential total loss of value. This instrument is not suitable for all investors.
- **Counterparty risk:** Synthetic ETFs and money market instruments expose the investor to swap counterparty credit risk within UCITS limits.
- **Currency risk:** Significant unhedged foreign currency exposure, primarily USD, JPY, and EM currencies.
- **Liquidity risk:** While all instruments are XETRA-traded, liquidity may deteriorate in periods of market stress, particularly for the Bitcoin ETP.
- **Regulatory and tax risk:** ETF structures, withholding tax treaties, and local tax treatment may change. Investors should seek independent tax advice applicable to their jurisdiction.

This document does not take into account individual investment objectives, financial circumstances, tax situation, knowledge and experience, or risk tolerance. Before investing, investors should read the Key Information Document (KID) and prospectus of each instrument and, if appropriate, seek independent financial, legal, and tax advice.

This portfolio has been constructed as a reference model applying CFA-level portfolio design principles.
